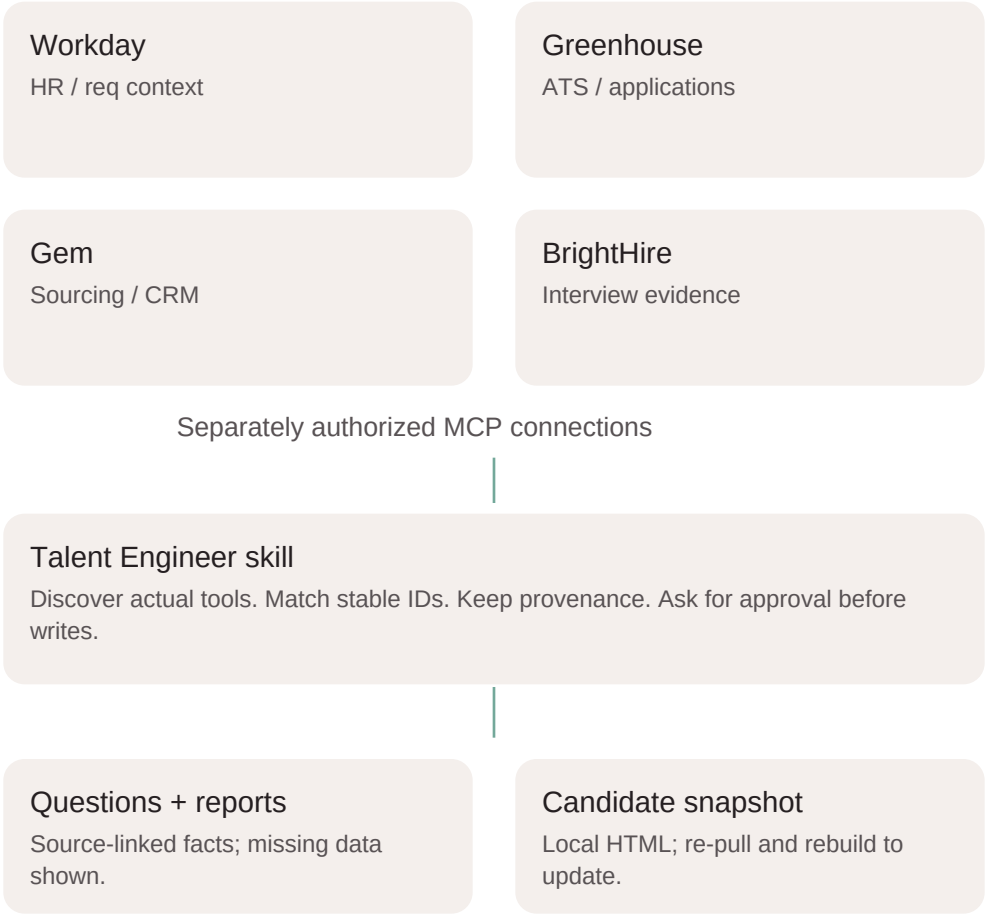
Talent Engineer

Audited skill for the Gong interview proposal

One Claude skill for asking questions, preparing reports, designing automations and building a four-source candidate snapshot.

Architecture



Automation recipes: n8n, Make and scheduled jobs require their own deployed runner, credentials, tests and approval. No importable workflow is included.

Safety: no automatic rejection or employment decisions. Evidence coverage is process completeness, not candidate quality. Real candidate sites need company SSO and record-level access controls.

Ready to upload. Not yet live.

Install the ZIP unchanged

1. Save talent-engineer-v1.1.zip to Files or Downloads. Do not unzip it for Claude chat.

2. In Claude, enable code execution/file creation and Skills if needed. Open Customize > Skills > + > Create skill > Upload a skill.

3. Select the ZIP and enable it. Organization policies or security scanning may delay activation. Actual account upload is untested.

Try it now with fake data

"Use Talent Engineer in demo mode. Run the included tests and build the sample candidate page. Do not call live systems."

What passed

17 automated tests passed. Checked ZIP integrity, folder/name match, YAML frontmatter, JSON configuration, file references, Python compilation, failure logging/reset and candidate-page validation. Phone and desktop demo layouts inspected.

What still needs setup

Connectors are separate from skills. Greenhouse: documented MCP, open beta and admin scopes. Gem: documented MCP and existing permissions. BrightHire: official MCP confirmed; precise endpoint must be verified in vendor setup. Workday: administrator registration, eligible configuration and tenant-specific tools.

No live Gong connection, Claude activation, deployed automation, SSO site or automatic refresh has been tested. The failure STOP rule is instruction-driven, not a background monitor. Empty logs do not prove a healthy connection.

Corrections included

Fixed shell syntax, numeric/null crashes, misleading live labels, invalid coverage, corrupt-log handling and history deletion. Removed unverified endpoint configuration. BrightHire does have an official MCP; the older "no API" framing should not be used.

Official sources and detailed test notes are in references/systems.md and AUDIT.md inside the ZIP. This is a locally tested prototype, not a production deployment.
